DATA ACADEMIA

LIMO Group Project | CS3520 Computer Organisation and Architecture

TEAM CHARTER

Data Academia is a collaborative team working to design and document LIMO, a simplified RISC-V-inspired processor. We aim to produce accurate, well-tested work through clear communication, shared responsibility, and decisions every member can explain.

Meetings	Fridays and Saturdays at 18:00, with additional virtual meetings when needed. We set an agenda, record decisions and action items, and assign an owner and deadline to each task.
Decisions and disagreements	We discuss the evidence and compare options first, then decide by majority vote. If the vote is tied or the issue remains unclear, we document the options and ask the course coordinator for guidance.
Work and accountability	Tasks are tracked on the project board and assigned with clear deliverables and deadlines. Members raise blockers early, communicate progress, and help one another understand the design rather than working in isolation.
Branches and pull requests	Each task is developed on a separate branch named feature/-short-description or fix/-short-description. Changes are submitted through a pull request, reviewed by at least one teammate, tested, and merged into main. Thabelo coordinates integration and review; main remains protected.
Definition of done	A task is complete when its acceptance criteria are met, relevant tests pass, documentation is updated, and a reviewed pull request has been merged and the project-board issue closed.
Absence or missed contribution	A member who cannot attend or meet a deadline informs the team as early as possible and shares their progress. The team checks in privately, agrees on support or a revised plan, and reassigns urgent work if necessary. Repeated or unresolved issues are raised with the course coordinator.

Project Board: github.com/Kirito-36/limo-Data-Academia

Working principle: We value a correct, understandable and tested solution over work that is merely finished quickly.
